#### Web Interface

#### Introduction

CyberPower's Intelligent Power Distribution Unit (PDU) and Automatic Transfer Switch (ATS) Web Interface gives users all the features they need to configure, manage, and monitor the Intelligent PDU/ATS Series via a Web browser. With this easy-to-navigate interface, users can perform realtime monitoring of each outlet, control individual outlet, set power alerts, and complete many other tasks in an intuitive manner.

#### How to Log in

## CyberPower PDU Remote Management

Remote Management - LOGIN		
Name	cyber	
Password	••••	
	Automatic Login	
	LOGIN	

© 2010-2016, CyberPower Systems, Inc. All rights reserved.

- 1. Open a Web browser.
- Enter the IP address of the CyberPower PDU/ATS in the Browser Address Bar, and then press ENTER.

Note: To look up the IP address, please refer to the LCD screen of the PDU/ATS.

3. Enter the information for the User **Name** and **Password** fields. There are two types of user accounts.

Account Type	Default User	Default	Authorization
	Name	Password	
Administrator	cyber	cyber	View, access, and control all
			settings.
Viewer	device	cyber	View all settings.

4. Click LOGIN to open the Summary Tab.

#### **General Settings**

These are the basic settings for the PDU/ATS.

1. Date and Time Settings

The date and time can be set manually or synchronized with a Network Time Protocol (NTP) server. All time-related configurations are based on this setting. See System Tab > General > Time.

	System ra	
PDU Remote Managemen		iinistrator login from 192.168.25.28 😪 [Logout] mmary   PDU   Envir   Log   System   Help

ltem	Definition
Reboot System	Restart the System without turning off and restarting the PDU/ATS outlets.
Reset System	Reset the System to default setting and restart it. This action do not turn off or restart the PDU/ATS outlets.
Reset System (TCP/IP Settings Reserved)	Reset the System to default setting but reserving TCP/IP settings, and restart it. This action do not turn off or restart the PDU/ATS outlets.

#### - -

#### 5. Environmental Monitoring

PDU/ATS with CyberPower ENVIROSENSOR can provide remote monitoring of temperature and humidity in a server closet and/or datacenter. You can set temperature and humidity threshold for event action warning. See Envir Tab > Status & Envir Tab > Configuration. Note that Envir Tab only appears when an ENVIROSENSOR is connected to the PDU/ATS.

Envir Tab > Status

	#3 Name & State	Contact#3 , Normally Open V
	#4 Name & State	Contact#4 , Normally Open v
	Apply Reset	

ltem	Definition			
Information				
Name	The name entered by user to identify the ENVIROSENSOR.			
Location	The location of the ENVIROSENSOR, entered by the user.			
Temperature				
High Threshold	Set the highest temperature value for a high temperature warning.			
Low Threshold	Set the lowest temperature value for a low temperature warning.			

ltem	Definition			
Hysteresis	The point where the environmental state changes from abnormal to normal and users receive a clearing event notification. The function of Hysteresis is to avoid receiving multiple event notifications. *For high threshold, the point is the threshold minus the Hysteresis value; for low threshold, the point is the threshold plus the Hysteresis value. For example: The high threshold is 32°C, and hysteresis is 2°C. The temperature rises to 33°C, you will get a warning. Then it goes down to 31°C and up to 33°C repeatedly. No clearing events and warnings will occur while the temperature readings are within the Hysteresis. You will not get a clearing event until it drops to 30°C.			
Rate of Change	Define the abnormal change of temperature per 5 minutes. For example: The current temperature is 23°C, and rate of change is 10°C. If it goes up to 33°C or down to 13°C within 5 minutes, you will get a warning.			
Unit	Select the unit of temperature.			
Humidity				
High Threshold	Set the highest humidity value for a high humidity warning.			
Low Threshold	Set the lowest humidity value for a low humidity warning.			
Hysteresis	Same as Hysteresis under temperature.			
Rate of Change	Same as <i>Hysteresis</i> under temperature.			
Contact	Enter the name of each input dry contact relay and use the dropdown menu to define the normal status of each one.			

#### **Advanced Power Management**

#### **Remote Monitoring**

Users can see real-time readings of PDU/ATS vitals such as device load, power consumption, and outlet status for an overview of current PDU/ATS status. See Summary Tab, PDU/ATS Tab > Status, and PDU/ATS Tab > Status > Outlet.

Item	Definition				
	Select the role of PDU/ATS (HOST or GUEST#) if PDU/ATS s are daisy				
HOST/GUEST#	chained. Up to 3 GUEST PDU/ATS s can connect to 1 HOST PDU/ATS.				
Status The on/off status of each outlet.					
Load (A)	Load current of each outlet, measured in Amps.				
Load (kW)	Load power of each outlet, measured in Kilowatts.				
	The maximum load current recorded and the time of occurrence. Users				
Peak Load (kW)	can reset the value to zero at Power Restore in PDU/ATS Tab >				
	Manager > Outlet.				
	Total energy consumed by connected equipment of each outlet since the				
Energy (kWh)	last reset. The reset can be set in <b>PDU/ATS Tab &gt; Manager &gt; Outlet</b> .				

#### **Visible Power Consumption**

With comprehensive energy measurement data, users can gain more visibility to the total power usage of a PDU/ATS or the status of source A and B of an ATS, as well as estimate the energy cost and CO2 emissions. The energy-trend report also helps users analyze their power utilization and to review the history of power conditions. See Log Tab > Status Records, Log Tab > Graphing, Log Tab > Energy Records, and Log Tab > Maintenance.

ltem	Definition
HOST/GUEST#	Select the role of PDU/ATS (HOST or GUEST#) if PDUs/ATS are daisy chained. Up to 3 GUEST PDU/ATSs can connect to 1 HOST PDU/ATS.
Source A/B Max (V)*	The maximum voltage of the Source A/B during a specific time interval, measured in Volts. This interval can be set in Log Tab > Maintenance.
Source A/B Min (V)*	The minimum voltage of the Source A/B during a specific time interval, measured in Volts. This interval can be set in Log Tab > Maintenance.
Source A/B (Hz)*	Frequency of the Source A/B.
Device Max (A)	The maximum load current of the connected device(s) or bank during a specific time interval, measured in Amps. This interval can be set in Log Tab > Maintenance.
Device (A)	Load current of the connected device(s) or bank, measured in Amps.
Dev. (W)	Watt of the connected devices(s) or bank, measured in Watts.
Voltage (V)	Voltage of the utility power.
ENV# Temp. (°C)	Temperature reading when the SNEV001# is connected to the PDU/ATS.
ENV# Hum. (%RH)	Humidity reading when the SNEV001# is connected to the PDU/ATS.
Temp. (°C)	Temperature reading when the ENVIROSENSOR is connected to the PDU/ATS.
Hum. (%RH)	Humidity reading when the ENVIROSENSOR is connected to the PDU/ATS.
Outlet # Max (kW)**	The maximum load power of a specific outlet during a specific time interval, measured in Kilowatts. This interval can be set in Log Tab > Maintenance.
Outlet # (kW)**	Load power of a specific outlet, measured in Kilowatts.

\*For ATS Series only

\*\*For Switched Metered by Outlet Series and Metered by Outlet Series only.

ltem	Definition
Event Logs	
Clear All Logs	Clear the existing event logs.
The Number of Events	The number of the existing event logs and the maximum number of the event logs that can be recorded. Once the maximum number is reached, new events overwrite oldest events in memory.
Save Event Logs	Save the existing event logs as a text file.
Status Records	
Recording Interval	<ul> <li>The frequency to record the status data.</li> <li>A smaller interval will provide more recordings, but the recordings are overwritten in a shorter period of time. A larger interval will provide fewer recordings, but the recordings are overwritten in a longer period of time.</li> </ul>
Clear All Records	Clear the existing status records.

Item	Definition	
	The time that records have been kept. A smaller recording interval	
Pomoining Timo	leads to less remaining time while a larger recording interval leads	
Remaining Time	to more remaining time. Once the maximum number is reached,	
	new status records overwrite oldest status records in memory.	
Save Status Records	Save the status records as a text file.	
Energy Records		
Recording Interval	The frequency to record the energy data.	
Clear All Records	Clear the existing energy records.	
Electricity Dete	The cost (units) of energy per unit of energy consumed (kWh). Unit	
Electricity Rate	is a monetary value.	
CO2 Emissions	The equivalent CO2 emission (kg) per unit of energy consumed	
CO2 Emissions	(kWh).	
Save Energy Records	Save the existing energy records as a text file.	

#### **Event Logging**

Users can view all the events, including log in/out records and configuration changes. The timestamp is recorded in a 24-hour format. See Log Tab > Syslog and Log Tab > Event Logs. For event logs, Users can clear the existing event logs in Log Tab > Maintenance

SNMPv1	If choosing the SNMPv1 option as the trap type for a trap receiver, select the corresponding community. See <u>System Tab &gt; Network</u> <u>Service &gt; SNMPv1 Service</u> .		
SNMPv3	If choosing the SNMPv3 option as the trap type for a trap receiver, select the corresponding user name. See <u>System Tab &gt; Network</u> Service > SNMPv3 Service.		

## 3. SMS Notification

Short Message Service (SMS) is used by mobile communication systems to send a short message to a specific mobile phone number. Standardized communication protocols allow the exchange of short text messages between mobile devices.

The system provides four methods for users to choose how they want to send a message. See System > Notification > SMS Service.

## PDU/ATS Tab > Outlet Action > Control

ltem	Definition
	Select the role of PDU/ATS (HOST or GUEST#) if PDU/ATSs are
HOST/GUEST#	daisy chained. Up to 3 GUEST PDU/ATSs can connect to 1
	HOST PDU/ATS.
Control Action	
Turn On	Selected outlets will be immediately turned on.
Turn On I Dolov	Selected outlets will be turned on according to each outlet's
Turn On + Delay	Power On Delay in PDU/ATS Tab > Manager > Outlet.
Turn Off	Selected outlets will be immediately turned off.

ltem	Definition					
	Selected outlets will be turned off according to each outlet's Power					
	Off Delay in PDU/ATS Tab > Manager > Outlet.					
Turn Off + Delay	This action could signal a computer to shut down, if PowerPanel®					
	Business Remote software is installed on it.					
	Selected outlets will be immediately turned off and then be turned					
Reboot	on again according to each outlet's <i>Reboot Duration</i> in PDU/ATS					
	<u>Tab &gt; Manager &gt; Outlet</u> .					
	Selected outlets will be turned off according to each outlet's Power					
	Off Delay. They will be synchronized with the longest Power Off					
Reboot + Delay	Delay and the longest Reboot Duration of the selected outlets.					
	Then they will be turned on according to each outlet's Power On					
	<i>Delay</i> in <u>PDU/ATS Tab &gt; Manager &gt; Outlet</u> .					
Cancel Pending	Any pending commands of the selected outlet(s) will be cancelled.					
Command	Any outlet in a pending command state will be notated with an					
	asterisk (*).					
Outlet Selection	Outlets selected for action.					

### Scheduled Outlet On/Off/Reboot

Outlet(s) can be set to automatically turn on, turn off, or reboot at scheduled times. See PDU/ATS Tab > Outlet Action > Schedule. (For Switched Metered by Outlet Series and Switched Series only.)

PDU Remote Managemer		Administrator Summary	login from 192.168.25.28	≩[Logout] Log   System   Help

Up to	10	sched	uled	se	ttings	are	allow	ed.
		_						

ltem	Definition					
Enable	Check this box to activate the scheduled action function.					
Name	The name entered by the user to identify the specific scheduled event.					
	The action will be performed when the scheduled event takes place.					
	For reboot action, selected outlets will be immediately turned off and					
Control Action	then be turned on again according to outlet's Reboot Duration in					
	<b>PDU/ATS Tab &gt; Manager &gt; Outlet</b> . The duration is within 5 to 60					
	seconds.					
Delay	Click this box to activate outlet delay function. For configurations, see					
Delay	PDU/ATS Tab > Manager > Outlet					
Action Time	The time at which the scheduled event takes place.					
Outlet Selection	Outlets selected for the scheduled event.					

## Sequencing Power On/Off/ Load Configuration

Enable users to turn on, turn off, or reboot the outlets in sequence. When powering on the connected devices, the sequential power-on method is recommended to avoid high inrush current. (For Switched Metered by Outlet Series and Switched Series only.)

The configurable load threshold can be set to prevent an overload condition. Users can set the value for amount of current placed on the selected outlet(s) that will signal an Overload threshold, Near Overload threshold, and Low Overload threshold warning. (For Switched Metered by Outlet Series and Metered by Outlet Series only.)

### See PDU/ATS Tab > Manager > Outlet.

Threshold	Threshold.					

Item	Definition
Low Overload	Set the value for individual outlet that will signal a low overload warning
Threshold	in Watts. Must be lower than Near Overload Threshold.
Power Restore	
Peak Load	Restore the peak load of each outlet to zero.
Energy	Restore the energy of each outlet to zero.

\* For Switched Metered by Outlet Series and Switch Series only.

\*\* For Switched Metered by Outlet and Metered by Outlet Series only.

#### AutoPing

The AutoPing feature allows the PDU/ATS to detect if a target device becomes unresponsive to IP pings and automatically reboot the device. If the device gets back to normal operation after reboot, network connection could be restored at the same time.

To utilize the function, See PDU/ATS Tab > Outlet Action > AutoPing. (For Switched Metered by Outlet Series and Switched Series only.)

PDU Remote M	<b>anagement</b>				03.50 <mark> [Log</mark> out] System   Help				Cyt	er <b>Power</b>
	AutoPing

Manager Outlet Action	New	_								
Control										
Schedule										
AutoPing										
Wake on Lan										
EnergyWise										
PowerPanel <sup>®</sup> List										

AutoPing configuration is shown as below. For example, the AutoPing function is enabled on Outlet 1 with 192.168.203.64 as "Target IP address". The PDU/ATS sends IP pings to the target device every 30 seconds. Outlet1 reboots once only if ping tests fail 3 times in a row, which takes 90 seconds for the PDU/ATS to detect the failure and trigger the action. After Outlet1 reboots, no pings are sent to the target device until 1 minute of "Restart Delay" is reached.

	8 Outlet8	16 Outlet16	

Intelligent PDU/ATS User Guide

Up to 10 AutoPing settings are allowed.

ltem	Definition			
Active	Enable/Disable the AutoPing function.			
Priority IP Address	When "Yes" is selected, sets the IP address of the priority to utilize the function. Pings will only be sent to the target device when receiving a successful ping response from the priority. For example, the target device is connected to a router, which is set to be the priority. The PDU/ATS sends IP pings to the target device only if the router is responsive to IP pings. In this way, the PDU/ATS can verify network connection by sending IP pings to the priority first and determine if target IP ping test is performed accordingly.			
Target IP Address	The IP address of the target device.			
Period The time interval between successive pings to the target device second.				
Retries The number of failed ping tests that must be consecutively before the action is triggered.				
Action The action on specific outlet if the PDU/ATS continuously receives maximum number of times to be triggered.				
Restart Delay	Length of time after an action is triggered before beginning to restart ping tests. This allows a proper time for the device to get back to normal operation. During this time interval, no pings are sent to the target device.			

After confirming the AutoPing configuration and pressing "Apply" button, find your preferred configuration and AutoPing status on AutoPing Webpage.

## Wake on LAN (WoL)

When turning on an outlet, a Wake on LAN packet can be sent to the connected computer to awaken it. It is necessary for the computer to support this function and is configured as "Enabled" in its BIOS settings. See PDU/ATS Tab > Wake on LAN > Features and PDU/ATS Tab > Wake on LAN > Lists. (For Switched Metered by Outlet Series and Switched Series only.)

ltem	Definition	
Active	Enable/Disable the Wake on LAN function.	
IP Address	The IP address of the computer. This IP must be within the same subnet as the PDU/ATS. Up to 50 IP addresses are supported.	
Outlet	Select the outlet that provides power to the computer.	

#### **Graceful Computer Shutdown**

After the connected computer is installed with PowerPanel Business Remote or Management and establishes communication with the PDU/ATS, its IP address will be automatically displayed in the PowerPanel® List shown below. This computer can perform a safe shutdown before the outlet powering the computer turns off, thus avoiding data loss. To achieve communication between the computer and PDU/ATS, see System > General > Security.

Up to 50 computers having PPBE Remote or Management installed can be listed. A Remote or Management computer will be removed when it has been disconnected from the PDU/ATS for an hour. See PDU/ATS Tab > PowerPanel® List. (For Switched Metered by Outlet Series and Switched Series only.)

Users can create an outlet account that is allowed to control assigned outlet(s).

Item	Definition	
Active	Enable or disable the user account.	
User Name	Set a name for the user account.	
Password	Set the user password.	
	Select the role of the PDU/ATS (HOST or GUEST#) if PDU/ATSs are	
Role	daisy chained. Up to 3 GUEST PDU/ATSs can connect to 1 HOST	
	PDU/ATS.	
Outlets Selection	Outlets that the user can control.	

2. Using RADIUS Configuration for Authentication

Click Add Server to enter Radius Server Configuration Page to create a server.

PDU Remote Ma	anagement	Administrator login from 192.168.210.219 🛖 [Logout] 🛛 💻 Summary PDU Log System Help
	RADIUS Server Co	onfiguration
General Security Management Local Configuration RADIUS Configuration LDAP Configuration Session Control	Server IP Shared Secret Server Port Authentication Type Timeout	0.0.0.0 1812 [default:1812] PAP
Network Service Notification Reset/Reboot About	<ul> <li>Test Setting User Name Password</li> <li>Skip Test</li> <li>Apply Reset</li> </ul>	

ltem	Definition
Server IP	The IP address of RADIUS server.
Shared Secret	The shared secret of RADIUS server.
Server Port	The UDP port used by the RADIUS server.
Authoption	The authentication protocol type for RADIUS Server.
Authentication Type	Password authentication protocol (PAP)
	Challenge-Handshake Authentication Protocol (CHAP)
Timeout	The time of waiting to login Radius server.
Toot Sotting	Use user name and password to authenticate with RADIUS server, and
Test Setting	save information of RADIUS server if authentication succeeds.
Skip Test	Save information of the RADIUS server without test.

System > Network Service > TCP/IPv4

ltem	Definition	
Current	Display the current TCP/IP settings: IP Address, Subnet Mask, Gateway,	
Configuration	and DNS server.	
DHCP	*Enable DHCP: Select this option to get IP address, Subnet Mask, and	
	Gateway from DHCP.	
	*Obtain DNS Address from DHCP: Select this option to get DNS by DHCP	
	if DHCP is enabled.	
Manual	Unselect Enable DHCP first.	
	Enter the TCP/IP settings manually and click Apply.	

ltem	Definition
	Configure a host name.
Host Name	*Synchronization with Identification Name - Allow the identification name to be synchronized with the host name so both fields automatically contain the same value.
	Note: When enabling this feature, the identification name can only contain numbers (0-9), letters (a-z, A-Z), hyphen and decimal point. Besides, the identification name should not start with hyphen or decimal point.

# **TCP/IPv6 Setting**

Display the current TCP/IPv6 settings and allow users to assign the IPv6 address either by router control or manually. See System > Network Service > TCP/IPv6.

ltem	Definition				
Community	The name used to access the SNMP community from a Network				
Community	Management System (NMS). Its maximum length is 15 characters.				
	The IP address or IP address mask can be accessed by the NMS. A				
	specific IP address allows access only by the NMS with the specified IP				
	Address. The "255" is regarded as the subnet mask and the rules are as				
IP Address	follows:				
(IPv6 Support)	*192.168.20.255: Access only by an NMS on the 192.168.20.0 segment.				
	*192.255.255.255: Access only by an NMS on the 192.0.0.0 segment.				
	*0.0.0.0 (the default setting) or 255.255.255.255: Access by any NMS on				
	any segments.				
	The allowable action for the NMS through the community and IP address.				
	*Read Only: GET at any time but cannot SET.				
Access Type	*Write/Read: GET at any time. SET at any time unless someone logs				
	in to the Web interface.				
	*Forbidden: No GET or SET.

			U ILS_KSA_WIIH_AES_128_CBC_SHA256	

ltem	Definition		
Access			
	Enable or disable HTTP/HTTPS service.		
	HTTPS supports the following encryption algorithms:		
Allow Access	<ul> <li>AES (256/128 bits)</li> </ul>		
	Camellia (256/128 bits)		

ltem	Definition
Http Settings	
	The TCP/IP port of the Hypertext Transfer Protocol (HTTP); 80 is the
HTTP Port	default value.
	Users can also change the port setting to any unused port from 5000 to
	65535 to enhance security.
Https Settings	
	The TCP/IP port of the Hypertext Transfer Protocol Secure (HTTPS); 443
Https Dort	is the default value.
Https Port	Users can also change the port setting to any unused port from 5000 to
	65535 to enhance security.
	*Valid Certificate: Display the detailed certificate information.
Certificate	*Upload Certificate: Upload a certificate and replace the
Status	current one. The certificate must be uploaded in standard PEM
	(Privacy Enhanced Mail) format.
Cipher suites	Set the Cipher suite to either Enable or Disable.

Click the <u>Valid Certificate</u> link, and the Installed Certificate Page will appear.

ltem	Definition
Access	
Allow Access	Enable access using Telnet or SSH version 2, which transmits user
Allow Access	names, passwords, and data in an encrypted format.
Telnet Settings	
	The TCP/IP port that Telnet uses to communicate; 23 is the default value.
	Users can change the port setting to any unused port from 5000 to 65535
Telnet Port	to enhance security.
	Note: Telnet Client requires users to enter a space and the port number
	after the PDU/ATS IP address on the command line to access the control
	console.
SSH Settings	

Item	Definition	
	The TCP/IP port that SSH uses to communicate; 22 is the default value.	
SSH Port	Users can change port setting to any unused port from 5000 to 65535 to	
	enhance security.	
	Display the status of hostkey fingerprint to show whether it is valid or	
	invalid.	
Hostkey Status	Click Upload Hostkey to upload or change hostkey.	
	Click Export Hostkey to export a current hostkey.	
Hostkey	The boother for some intervalse deal by severe will be disclosed in this field.	
Fingerprint	The hostkey fingerprint uploaded by users will be displayed in this field.	

# **FTP Service**

Allow users to enable/disable the FTP server service and configure the TCP/IP port of the FTP server. The FTP server is used for upgrading Firmware. See System Tab > Network Service > FTP Service.

# System > About

ltem	Definition
Information	
Model Name	Model name of the PDU/ATS.
Serial Number	Serial Number of the PDU/ATS.
Hardware Version	The hardware version of the PDU/ATS.
Firmware Version	The current firmware version installed on the PDU/ATS.
Firmware Updated Date	The date the firmware was last updated.
MAC Address	MAC address of the PDU/ATS.
	Note: The MAC address is shown on the label on the back of

	the PDU/ATS and via the LCD screen on the PDU/ATS.
Save/Restore Settings	
	Click Save to save the PDU/ATS configuration file to local
Save Configuration	computer. The text file name will have a default format of
	YYYY_MM_DD_HHMM.txt.
	To restore a configuration that has been saved earlier.
Restore Configuration	Click Select File to import an existing configuration file and
	then click Submit.
Diagnostic Information	
	Click the "Save" button to save all diagnostic information to a
	file. The saved information includes Event Logs, Status
Save Information	Records and other device information. Its suggested to have
	this information saved when contacting CyberPower Technical
	Support for assistance.

# **Command Line Interface**

# Introduction

## How to log on

Users can log on to the command line interface through either console network access (Telnet or SSH) or local access (Serial port).

1. Network access to the command line interface

When user logs in with the admin username and admin password through Telnet or SSH, there are two types of interfaces available. One is the command line interface (CLI) and the second is a menu interface. The default is CLI. If the user wants to change to the menu interface, type in the [menumode] command. To switch back to CLI, it is necessary to logout and login to the PDU/ATS.

2. Local access to the command line interface

To log on via serial connection, the PC/server must be connected directly to the Universal port of the PDU/ATS using the included RJ45/DB9 Serial Port Connection Cable, and perform the following steps.

- Step 1: Open Hyper Terminal software (eg. PuTTY, HyperTerminal, or Tera Term) on your PC and select a name and icon for the connection.
- Step 2: Setup the COM port settings using the following values
  - \*Bits per second: 9600
  - \*Data bits: 8
  - \*Parity: None
  - \*Stop bits: 1
  - \*Flow control: None
- Step 3: Press Enter to enter the Authentication menu.
- Step 4: Enter the user name and password of the PDU/ATS at the Authentication menu.

Note: Serial connection can only access Command Line Mode and cannot support Menu Mode.

#### How to use telnet access command line interface

- Step 1: Need to make sure the computer has access to the PDU/ATS installed network. At a command prompt, type telnet and the IP address for the PDU/ATS (for example, telnet 139.225.6.133, when the PDU/ATS uses the default Telnet port of 23), and press Enter.
- Step 2: Enter the user name and password (by default, user name: cyber, password: cyber)

## How to use SSH access command line interface

SSH is highly recommended for using to access the command line interface. SSH encrypts user

names, passwords, and transmitted data. To use SSH you must first configure SSH and install an SSH client program (eg. PuTTY, HyperTerminal, or Tera Term) on your computer.

**Note:** If using PuTTY to configure SSH access, please configure Line discipline of Terminal to "Force off", as shown in Figure 5.

Reputry Configuration	X
Category:	
E Session	Options controlling the terminal emulation
Jession     Logging     Terminal     Keyboard     Bel     Features     Window     Window     Mapearance     Behaviour     Translation     Selection	Set various terminal options Auto wrap mode initially on DEC Origin Mode initially on Implicit CR in every LF Implicit LF in every CR Use background colour to erase screen Enable blinking text Answerback to ^E: PuTTY

i Senal	Remote-controlled printing Printer to send ANSI printer output to: None (printing disabled)
About	Open Cancel

Figure 5. The PuTTY Configuration window.

## How to use the Command Line Interface

While using the command line interface, you can also do the following:

- 1. To close the connection to the command line interface → Type "exit" and press Enter
- 2. To switch mode as Menu Mode  $\rightarrow$  Type "menumode" and press Enter
- 3. To view a list of available commands or arguments → Type "?" (Eg. date ?).
- To view the command that was typed most recently in the session → Press the UP/DOWN arrow key. (The session can remember up to ten previous commands.)
- 5. A command can support multiple options → To define the date as March 21, 2015 (Eg. date yyyy 2015 mm 3 dd 21)

## **Command Response Codes**

When the command or arguments is not recognized or is incorrect, the console interface will display [^] underneath the wrong command or argument. The following error message will be displayed:

Command not found	PDU/ATS doesn't know this command.	
Command not found	Console interface display the list of available commands.	
Parameter Error	The parameter type or format is not allowed.	

Console interface display the list of available value or format.

# **Command Lists**

#### devsta

Description: Show device status of load and utility.

Option	Argument	Description
show		Show information of system device load and utility status.
guest	1   2   3	Select daisy chain index.

Example 1:

To display device status

CyberPower > devsta show

#### devcfg

Description: Show and set device load threshold, reset power parameters in device level, set cold start status and delay.

Option	Argument	Description
show		Show information of device configuration.
guest	1   2   3	Select daisy chain index.
overload	<overload threshold="" value=""></overload>	Set device overload threshold value.
nearover	<near overload="" threshold="" value=""></near>	Set device near overload threshold value.
lowload	<low load="" threshold="" value=""></low>	Set device low load threshold value.
restriction	<none onnear onover></none onnear onover>	Set outlet restriction of device.
pwrrest	peakload   energy	Reset the peak load or energy of device.
coldstasta	previous   allon	Set the cold start state of device.
coldstadly	-1   0   1   2    300	Set the cold start delay of device.
idletime	1   2   3   5   10   never	Set idle time of device.

Example 1:

To display load configuration of the device

CyberPower > devcfg show

Example 2:

To set overload threshold at 10A

CyberPower > devcfg overload 10

## Example 3:

To set near overload threshold at 8A Intelligent PDU/ATS User Guide CyberPower > devcfg nearover 8

#### Example 4:

To set cold start delay at 0 CyberPower > devcfg coldstadly 0

#### Example 5:

To set idle time of the device at 10 minutes CyberPower > **devcfg idletime 10** 

## srccfg

Description: Show and set the source configuration. (For ATS Series only.)

Option	Argument	Description
show		Show information of source configuration.
guest	1   2   3	Select daisy chain index.
prefer	<a b none></a b none>	Set device preferred source.
freqdeviation	1   2  3	Set device frequency deviation
sensitivity	high low	Set device voltage sensitivity.
nomivol	<208   220   230   240> or	Set device nominal voltage.
ΠΟΠΙΙνΟΙ	<100   110  120>	
volrangepolicy	wide  medium  narrow	Set device voltage transfer range policy.
widevol	<voltage range=""></voltage>	Set device wide voltage transfer range.
mediumvol	<voltage range=""></voltage>	Set device medium voltage transfer range.
narrowvol	<voltage range=""></voltage>	Set device narrow voltage transfer range.

Example 1:

To display source configuration of the device CyberPower > srccfg show

#### Example 2:

To set preferred source of the device to be Source B CyberPower > srccfg prefer b

#### Example 3:

To set frequency deviation to be +/- 2Hz

CyberPower > srccfg freqdeviation 2

Example 4:

To set device voltage sensitivity to be Low

CyberPower > srccfg sensitivity low

Example 5:

Intelligent PDU/ATS User Guide

To set device nominal voltage at 100V

CyberPower > srccfg nomivol 100

# bankcfg

Description: Show and set bank load configuration.

Option	Argument	Description
show		Show information of bank load threshold.
guest	1   2   3	Select daisy chain index.
index	b1   b2   all	Select bank index.
overload	<overload threshold="" value=""></overload>	Set bank overload threshold value.
nearover	<near overload="" threshold="" value=""></near>	Set bank near overload threshold value.
lowload	<low load="" threshold="" value=""></low>	Set bank low load threshold value.
restriction	none   onnear   onover	Set outlet restriction of bank

Example 1:

To display bank load configuration

```
CyberPower > bankcfg show
```

```
Example 2:
```

To set overload threshold of bank 1 at 15A

```
CyberPower > bankcfg index b1 overload 15
```

Example 3:

To set near overload threshold of bank 2 at 10A CyberPower > bankcfg index b2 nearover 10

# oltsta

Description: Show information of outlet status.

Option	Argument	Description
show		Show information of outlet status.
guest	1   2   3	Selectdaisy chain index.
index	1   2    outlet number	Select outlet index.

Example 1:

To display all outlet status

CyberPower > **oltsta show** 

Example 2:

To display status of outlet #5

CyberPower > oltsta index 5 show

# oltcfg

Description: Show and set configuration of outlet action.

Option	Argument	Description
show		Show information of outlet delay time.
guest	1   2   3	Select daisy chain index.
index	1   2    outlet number   all	Select outlet index.
name	<outlet name=""></outlet>	Set outlet name.
td_on	-1   0   1   2    7200	Set outlet on delay time.
td_off	-1   0   1   2    7200	Set outlet off delay time.
td_reboot	<reboot duration="" time=""></reboot>	Set outlet reboot duration time.
set	<1   2    outlet number  all>	Set outlet configuration
	<outlet name=""></outlet>	
	<0   1   2    7200>	
	<0   1   2    7200>	
	<5   6    60>	

Example 1:

To display all outlet configuration CyberPower > **oltcfg index all show** 

Example 2:

To name outlet #1 as test\_1

CyberPower > oltcfg index 1 name test\_1

Example 3:

To set turn on delay of outlet #2 as 3 seconds CyberPower > **oltcfg index 2 td\_on 3** 

Example 4:

To set turn off delay of outlet #3 as 3 seconds

CyberPower > oltcfg index 3 td\_off 3

Example 5:

To set reboot duration of outlet #4 as 5 seconds

CyberPower > oltcfg index 4 td\_reboot 5

Example 6:

To name outlet #1 as test\_1, set turn on delay as 3 seconds, set turn off delay as 4 seconds and

set reboot duration as 5 seconds with a single command CyberPower > oltcfg set 1 test\_1 3 4 5

# oltloadcfg

Description: Show and set outlet load threshold, reset power parameters in outlet level.

Option	Argument	Description
show		Show information of outlet load threshold.
guest	1 2 3	Select daisy chain index.
index	1   2   outlet number   all	Select outlet index.
name	<outlet name=""></outlet>	Set outlet name.
overload	<overload threshold="" value=""></overload>	Set outlet overload threshold value.
nearover	<near overload="" threshold="" value=""></near>	Set outlet near overload threshold value.
lowload	<low load="" threshold="" value=""></low>	Set outlet low load threshold value.
pwrrest	peakload   energy	Reset the peak load or energy of outlet.

Example 1:

To display outlet load configuration

CyberPower > oltloadcfg show

Example 2:

To set overload threshold of outlet #1 at 1800W

CyberPower > oltloadcfg index 1 overload 1800

Example 3:

To set near overload threshold of outlet #2 at 1000W

```
CyberPower > oltloadcfg index 2 nearover 1000
```

Example 4:

To set low load threshold of outlet #10 at 100W CyberPower > **oltloadcfg index 10 lowload 100** 

## oltctrl

Description: Control the action of outlet.

Option	Argument	Description
Index	1   2    outlet number   b1   b2	Select outlet index.
muex	all	
guest	1   2   3	Select daisy chain index.
aat	on   off   reboot   delayon   delayoff	Control the action of outlet.
act	delayreboot   cancel	

Example 1:

To turn on outlet #1 immediately

CyberPower > oltctrl index 1 act on

Example 2:

To turn on outlet #2 with turn on delay CyberPower > **oltctrl index 2 act delayon** 

# schedule

Description: Show and configure the outlet schedule of device.

Option	Argument	Description
show		Show information of schedule.
guest	1   2   3	Select daisy chain index.
index	1   2    schedule number   10	Select schedule index.
		Add outlet schedule with a schedule name
		and follow the settings step by step.
		The parameters of <b>status</b>
		enable   disable
		The parameters of <b>action</b>
		on   off   reboot   delayon   delayoff
		delayreboot
		The parameters of <b>outlet</b>
		1   2   outlet number
		The parameters of <b>frequency</b>
add	once   daily   weekly	once   daily   weekly
		The Parameters of hour
		1  2  3   24
		The Parameters of minutes
		1  2  3   59
		The Parameters of day of week
		Mon   Tue   Wed   Thu   Fri   Sat   Sun
		The parameters of <b>month</b>
		1  2   12
		The Parameters of <b>day</b>
		1  2  3   31
name	<schedule name=""></schedule>	Set schedule name.
status	enable   disable	Set schedule status

Option	Argument	Description	
aat	on   off   reboot   delayon	Control the action of outlet.	
act	delayoff   delayreboot		
time	<hh:mm></hh:mm>	Set schedule time.	
date	<mm dd=""></mm>	Set schedule date.	
week	Mon   Tue   Wed   Thu   Fri   Sat	Set schedule week.	
	Sun		
oltnum	1   2    outlet number  b1  b2	Set the outlet number of schedule.	
	all		
delete		Delete the schedule.	

Example 1:

To display schedules of the device

CyberPower > schedule show

# date

Description: Show and configure timezone, date format, date, time.

Option	Argument	Description
show		Show system date information
уууу	<number of="" year=""></number>	Set year of system date by AD.
mm	<number month="" of=""></number>	Set month of system date.
dd	<number date="" of=""></number>	Set day of month.
format	mm/dd/yyyy   yyyy/mm/dd   dd.mm.yyyy   mmm-dd-yy   dd-mmm-yy   yyyy-mm-dd	Set system date format
timezone	<time offset="" zone=""></time>	Choose the time zone in GMT (Greenwich Mean Time).
time	<hh:mm:ss></hh:mm:ss>	Set system time.

Example 1:

To define timezone offset as +08:00 CyberPower > date timezone +0800

Example 2:

To define the date as March 21, 2015

CyberPower > date yyyy 2015 mm 3 dd 21

Example 3:

To define the time as 13:45:12

CyberPower > date time 13:45:12

Intelligent PDU/ATS User Guide

# ntp

Description: Show and configure NTP server IP, NTP update interval time.

Option	Argument	Description
show		Show all NTP information
000000	anabla I diaabla	If enable was set, System will set date and time from
access	enable   disable	NTP server.
n riin		Set the IP address/domain name of primary NTP
priip	<primary ip="" ntp="" server=""></primary>	servers
again	<secondary ip="" ntp="" server=""></secondary>	Set the IP address/domain name of secondary NTP
secip		servers
		<b>now</b> -Choose Update right now to update
update	now   1-8760	immediately.
		<b>1-8760</b> —Set the frequency to update the date and
		time from NTP server.

Example 1:

To enable NTP server define date and time CyberPower > **ntp access enable** 

Example 2:

To setup primary NTP server IP as "192.168.26.22"

CyberPower > ntp priip 192.168.26.22

Example 3:

To update time by NTP immediately

CyberPower > ntp update now

#### sys

Description: Show and configure identification of the device.

Option	Argument	Description
show		Show all system information
name	<system name=""></system>	Set name of the equipment.
location	<system location=""></system>	Set the location of power equipment.
contact	<system contact=""></system>	Set the person to contact about this equipment.
		Reboot-Reboot the device
		notcpip-Reset the System to default setting but
reset	reboot   notcpip   all	reserving TCP/IP settings, and restart it.
		all-Set all to reset the System to default setting and
		restart it.

Example 1:

To view all information of system

```
CyberPower > sys show
Name: PDU81001
Location: Server Room
Contact: Admainistrator
Model: PDU81001
Hardware Version: 1.1
Firmware Version: 1.0.3
Firmware Update Date: 03/08/2015
Serial Number: TALGY2001975
MAC Address: 00-0C-15-00-B9-42
```

Example 2:

To reset the device to default parameter. CyberPower > **sys reset all** 

## dst

Description: Show and configure type of Daylight Saving Time.

Option	Argument	Description
show		Show all DST information
		disable – Disable DST.
		us-Tradition US DST
		manual – Manual DST date time rules.
	disable   us   manual	After finish this command, input start and end time step by
		step.
		The parameters of Week of month:
mode		first   second   third   forth   last
		The Parameters of <b>day of week</b> :
		Mon   Tue   Wed   Thu   Fri   Sat   Sun
		The parameters of <b>month</b> :
		Jan   Feb   Mar   Apr   May   Jun   Jul   Aug   Sep   Oct   Nov
		Dec

Example 1:

```
Manual set Daylight Saving Time
   CyberPower > dst mode manual
   Start time (0~23): 2
   Start week of month: second
   Start day of week: Sun
   Start month: Mar
   End time (0~23): 2
   End week of month: first
   End day of week: Sun
   End month: Nov
Example 2:
   To view DST setting
   CyberPower > dst show
       DST: Manual DST Date Time
       Start: 02:00, the second Sunday of Mar
       End: 02:00, the first Sunday of Nov
```

# login

Description: Show and configure authentication for login.

Option	Argument	Description
show		Show all login information
		<b>local</b> —User to login Remote Management Card with
		user name and password that configured in Local
		Account.
		radiuslocal – User to login Remote Management Card
		with user name and password for authenticate with
		RADIUS server first. If the RADIUS server fails to
		respond, the user name and password that configured
		in Local Account will be used.
	local   radiuslocal	radiusonly-User to login Remote Management Card
type	radiusonly   Idaplocal	with user name and password for authenticate with
	Idaponly	RADIUS server only.
		Idaplocal – User to login Remote Management Card
		with user name and password for authenticate with
		LDAP server first. If the LDAP server fails to respond,
		the user name and password that configured in Local
		Account will be used.
		Idaponly-User to login Remote Management Card
		with user name and password for authenticate with
		LDAP server only.
cocrotobraca	<authentication phrase=""></authentication>	The Authentication Phrase used to communicate with
secretphrase	<authentication phrase=""></authentication>	PowerPanel Business Remote.
		The period (in minutes) that the system waits before
timeout	1~10	auto logging off. The range of argument is from 1 to 10
		(in minutes).

Example 1:

To change authentication type to Radius, Local Account CyberPower > **login type radiuslocal** 

## admin

Description: Show and configure administrator account and manager IP.

Option	Argument	Description
show		Show all admin information
primip	<primary ip="" manager=""></primary>	Set primary manager IP of admin
acomineo		Enable or disable secondary manager IP
secmipac	enable   disable	of admin
secmip	<secondary ip="" manager=""></secondary>	Set secondary manager IP of admin
name	<administrator account=""></administrator>	Set user name of admin
passwd	<administrator password=""></administrator>	Set user password of admin

Example 1:

To change the primary administrator account information with a single command (need current password)

```
CyberPower > admin name pri_name passwd pri_pass
Input admin password : cyber
pass
```

# device

Description: Show and configure viewer account and manager IP.

Option	Argument	Description
show		Show all viewer account information
access	enable   disable	Enable or disable viewer account
primip	<primary ip="" manager=""></primary>	Set primary manager IP of viewer account
secmipac	enable   disable	Enable or disable secondary manager IP of viewer
		account
secmip	<secondary manager<="" td=""><td>Set secondary manager IP of viewer account</td></secondary>	Set secondary manager IP of viewer account
	IP>	
name	<user name=""></user>	Set user name of viewer account
passwd	<user password=""></user>	Set user password of viewer account

# Example 1:

To define primary viewer manager IP as 192.168.26.0/24 CyberPower > device primip 192.168.26.0/24

#### oltuser

Description: Show and configure the outlet user.

Option	Argument	Description
show		Show information of outlet user.
index	1   2  outlet user number	Select outlet user index.
odd		Add outlet user then input user name/
add		password/ outlet number appear later on.
status	enable   disable	Enable of disable the status of outlet user.
name	<outlet name="" user=""></outlet>	Set the name of outlet user.
passwd	<outlet password="" user=""></outlet>	Set the password of outlet user.
	1   2    outlet number   b1   b2	Set the outlet number of outlet user.
	all	
		Set the daisy chain PDU/ATS's outlet
oltnum		number of outlet user.
oimum	g#<1   2   daisy chain index >-<1   2	Note1 : Host PDU/ATS doesn't need to type
	outlet number   b1   b2   all>;	"g# <daisy chain="" index="">-".</daisy>
		Note2 : End of outlet number list need to
		type Semicolon";"
delete		Delete the outlet user.

Example 1:

To display configuration of outlet users

	> <b>oltuser show</b> User Name	Manageable Outlets
2 Disa	outletuser2	1,2,3,4 g#1-5,6,7,8 1,3,5,7;g#1-2,4,6,8

Example 2:

To disable the outlet user #1

CyberPower > oltuser index 1 status disable

# Example 3:

To set host outlet 1,3,5, guest #1 outlet 2,4,6, and guest #2 outlet 7,8,9 to the outlet user #1 CyberPower > oltuser index 1 oltnum 1,3,5;g#1-2,4,6;g#2-7,8,9

Example 4:

To delete the outlet user #1

CyberPower > oltuser index 1 delete

# radius

Description: Show and configure information of RADIUS server.

Option	Argument	Description
show		Show all Radius server information
pri	show	Show primary/secondary Radius server
sec	SHOW	information.
add		Add radius server then input radius server
auu		IP/Secret/Port appear later on.
add	<pre><server ip=""> <server secret=""></server></server></pre>	Add radius server information including
auu	<server port=""></server>	server IP/Secret/Port at one time.
priip	<radius ip="" server=""></radius>	Set the IP address of primary/secondary
secip		RADIUS server.
priport	andius conver ports	Set the UDP port which is used by the
secport	<radius port="" server=""></radius>	primary/secondary Radius server.
prisecret	<radius secret="" server=""></radius>	Set the shared secret of primary/secondary
secsecret		Radius server.
pritype	<radius authentication<="" server="" td=""><td>Set the authentication type of</td></radius>	Set the authentication type of
sectype	type>	primary/secondary Radius server.
pridel		Doloto primany/socondary Padius conver
secdel		Delete primary/secondary Radius server

Example 1:

To view primary radius server information

CyberPower > radius pri show

```
Server IP: 192.168.26.33
```

Server Secret: testsecret

Server Port: 1826

Example 2:

To view secondary radius server information

CyberPower > radius sec show

Server IP: 192.168.30.58

Server Secret: testsecret2

Server Port: 1508

Enter the following command to add Radius server information configuration with a single command:

radius add <Server IP> <Share Secret> <Server Port><Authentication Type>

For example:

```
CyberPower > radius add 192.168.203.55 testsecret 150 pap
```

Note: This single command could not be executed successfully if there are two Radius servers to be set already.

## ldap

Description: Show and configure information of LDAP server.

Option	Argument	Description
show		Show all LDAP server information
add		Add LDAP server then input information for
auu		requirements appear later on.
pritype		Set the type of LDAD conver
sectype	openldap   ad	Set the type of LDAP server.
priip	<ldap ip="" server=""></ldap>	Set the IP address of primary/secondary LDAP
secip	<ldaf if="" server=""></ldaf>	server.
prissl	anabla I disabla	Enable or disable using LDAPS
secssl	enable   disable	Enable or disable using LDAPS.
priport	d DAD conver ports	Set the TCP port which is used by the
secport	<ldap port="" server=""></ldap>	primary/secondary LDAP server.
pridn	< LDAP server base DN>	Set the Base DN of primary/secondary LDAP
secdn	< LDAF Server base DIN>	server.
priaddomain	< LDAP server AD domain>	Set the AD Domain of the primary/secondary
secaddomain	< LDAP Server AD domain>	Active Directory server.
priattr		Set the Login Attribute of primary/secondary
secattr	< LDAP server login attribute>	LDAP user entry.
pridel		
secdel		Delete primary/secondary LDAP server.

Example 1:

To add LDAP Server CyberPower > ldap add Input LDAP Server Type [openldap | ad]: ad Input IP address: 192.168.26.33 Use SSL [enable | disable]: disable Input LDAP port: 389 Input base DN: dc=cyber,dc=com Input login attribute: cn Input AD Domain: cyber.com Example 2: To view information about LDAP Server CyberPower > ldap show Primary LDAP Server Type: Windows AD LDAP Server: 192.168.26.33 LDAP SSL: Disable Port: 389 Base DN: dc=cyber,dc=com Login Attribute: cn AD Domain: cyber.com

## tcpip

Description: Show and configure IPv4 IP, netmask, gateway, DNS.

Option	Argument	Description
show		Show all IPv4 information
dhcp	enable   disable	Enable or disable DHCP
dns	manual   auto	Auto-Obtain DNS Address from DHCP when DHCP enable Manual-Obtain DNS Address by manual when DHCP enable.
ір	<system ip=""></system>	Set IP Address of system
netmask	<system netmask=""></system>	Set netmask of system
gateway	<system gateway=""></system>	Set gateway of system
dnsip	<system dns=""></system>	Set DNS of system

Example 1:

To disable DHCP and define IP address to 192.168.26.33

CyberPower > tcpip dhcp disable ip 192.168.26.33

# tcpip6

Description: Show and configure status of IPv6 router control, IPv6 manual IP.

Option	Argument	Description
show		Show all IPv6 information
access	enable   disable	Enable or disable IPv6 service.
		The IPv6 address is assigned through the method (Stateless
routerctrl	enable   disable	Address Autoconfiguration, Stateless DHCPv6 or Stateful
		DHCPv6) which is decided by router setting.
manual	enable   disable	Enable or disable IPv6 manual ip.
ір	<manual ip="" ipv6=""></manual>	Set manual IPv6 ip.

#### Example 1:

To define IPv6 manual IP address then show the information of IPv6

CyberPower > tcpip6 ip 2001:cdba:0:0:0:3257:9652 show

Access: Enable Router Control: Enable Manual: Enable Manual IPv6 Address: [2001:cdba::3257:9652]

## snmpv1

Description: Show and configure status of SNMPv1.

Option	Argument	Description
show		Show SNMPv1 status.
index	1   2   3   4	Select SNMPv1 community index.
	<1   2   3   4> <community> <ip< td=""><td></td></ip<></community>	
set	Address> <readonly readwrite="" td=""  =""  <=""><td>Set SNMPv1 community information.</td></readonly>	Set SNMPv1 community information.
	forbidden>	
access	enable   disable	Enable or disable SNMPv1.
community	<community></community>	Set SNMPv1 community name.
ір	<ip address=""></ip>	Set SNMPv1 community IP address.
type	readonly   readwrite   forbidden	Set SNMPv1 community type.

#### Example 1:

To view the second SNMPv1 community information

CyberPower > snmpv1 index 2 show

Community: private

IP Address: 192.169.203.20

Type: Read/Write

Example 2:

To change the community name of first SNMPv1 community to Public1

CyberPower > snmpv1 index 1 community Public1

Example 3:

To change the IP address of third SNMPv1 community to 192.168.203.88 CyberPower > snmpv1 index 3 ip 192.168.203.88

Example 4:

To change the community type of forth SNMPv1 community to read/write CyberPower > snmpv1 index 4 type readwrite

Enter the following command to perform all parameters configuration with a single command:

```
snmpv1 set <1 | 2 | 3 | 4> <Community> <IP Address> <readonly | readwrite |
forbidden>
```

For example:

CyberPower > snmpv1 set 3 CyberPower 192.168.203.91 readonly

## snmpv3

Description: Show and configure status of SNMPv3.

Option	Argument	Description
Show		Show SNMPv3 status.
Index	1   2   3   4	Select SNMPv3 user index.
	<1   2   3   4> <community> <ip< td=""><td></td></ip<></community>	
Set	Address> <readonly readwrite="" td=""  =""  <=""><td>Set SNMPv3 user information.</td></readonly>	Set SNMPv3 user information.
	forbidden>	
Access	enable   disable	Enable or disable SNMPv3.
Name	<user name=""></user>	Set SNMPv3 user name.
Status	<enable disable=""  =""></enable>	Enable or disable SNMPv3 user.
lp	<ip address=""></ip>	Set IP address of SNMPv3 user.
Auth	md5   sha   none	Set authentication protocol of SNMPv3 user.
Authkey	<auth key=""></auth>	Set authentication password of SNMPv3
		user.
Priv	aes   des   none	Set privacy protocol of SNMPv3 user.
Privkey	<priv key=""></priv>	Set privacy password of SNMPv3 user.

Example 1:

To view the first SNMPv3 user information CyberPower > snmpv3 index 1 show Intelligent PDU/ATS User Guide

```
User Name: CyberPower
Status: Enable
IP Address: 192.169.30.58
Auth Protocol: MD5
Priv Protocol: aes
```

#### Example 2:

To change the user name of second SNMPv3 user to CyberPower CyberPower > snmpv3 index 2 name CyberPower

Example 3:

To enable the-third SNMPv3 user CyberPower > snmpv3 index 3 status enable

Example 4:

To change the IP address of forth SNMPv3 user to 192.168.203.66

CyberPower > snmpv3 index 4 ip 192.168.203.66

Example 5:

To change the authentication protocol of second SNMPv3 user to md5 and set its authentication password as test\_authkey\_123456

CyberPower > snmpv3 index 2 auth md5 authkey test\_authkey\_123456

Example 6:

To change the authentication password of first SNMPv3 user to test\_authkey\_123456

CyberPower > snmpv3 index 1 authkey test\_authkey\_123456

Example 7:

To change the authentication protocol of third SNMPv3 user to none

CyberPower > snmpv3 index 3 auth none

Example 8:

To change the privacy protocol of second SNMPv3 user to aes and set its privacy password as test\_privkey\_123456

CyberPower > snmpv3 index 2 priv aes privkey test\_privkey\_123456

Example 9:

To change the privacy password of first SNMPv3 user to test\_privkey\_123456

CyberPower > snmpv3 index 1 privkey test\_privkey\_123456

Example 10:

To change the privacy protocol of third SNMPv3 user to none

CyberPower > snmpv3 index 3 priv none

Enter the following command to perform all parameters configuration with a single command:

snmpv3 set <1 | 2 | 3 | 4> <User Name> <IP Address> <md5 | sha | none> <Auth
Key> <aes | des | none> <Priv Key>

For example:.

CyberPower > snmpv3 set 1 CyberPower 192.168.203.90 sha test\_authkey\_123456 des test\_privkey\_123456

#### trap

Description: Show and configure information of SNMP trap receiver.

Option	Argument	Description
show		Show trap receiver information.
add		Add trap receiver.
index	1   2     10	Select trap receiver index.
name	<trap name="" receiver=""></trap>	Set trap name of trap receiver.
ір	<trap ip="" receiver=""></trap>	Set IP address of trap receiver.
ver	v1   v3	Set SNMP version of trap receiver.
status	enable   disable	Enable or disable trap receiver.
community	<trap community="" receiver=""></trap>	Set SNMPv1 community name of trap receiver.
user	1   2   3   4	Select SNMPv3 user of trap receiver.
test		Trap receiver send test
delete		Delete trap receiver.

Example 1:

To view sixth trap receiver information

CyberPower > trap index 6 show

Trap Name: CyberPower Status: Enable IP Address: 192.168.203.68 Type: SNMPv1 Community: test\_community

Example 2:

To change the trap name of second trap receiver to test

CyberPower > trap index 2 name test

Example 3:

To change the IP address of third trap receiver to 192.168.30.85

CyberPower > trap index 3 ip 192.168.30.85

Example 4:

To change the SNMP version of forth trap receiver to SNMPv3 CyberPower > trap index 4 ver v3

Example 5:

To change the fifth trap receiver

CyberPower > trap index 5 status enable.

Example 6:

To change the community name of second trap receiver to CyberPower with the condition that the SNMP version of trap receiver must be SNMPv1.

CyberPower > trap index 2 community CyberPower

Example 7:

To change the SNMPv3 user of tenth trap receiver to SNMPv3 user2 with the condition that the SNMP version of trap receiver must be SNMPv3

CyberPower > trap index 10 user 2

Example 8:

To delete the fifth trap receiver

CyberPower > trap index 5 delete

Enter the following command to add trap receiver configuration with a single command:

For SNMPv1: trap add <Trap Name> <Trap Receiver IP> v1 <Community>

For example:

CyberPower > trap add CyberPower 192.168.203.16 v1 test

For SNMPv3: trap add <Trap Name> <Trap Receiver IP> v3 <1 | 2 | 3 | 4>

For example:

CyberPower > trap add cyberpower 192.168.203.12 v3 3

# web

Description: Show and configure web access type, http port and https port.

Option	Argument	Description
show		Show all web information
		http-Enable the access to http service.
access	http   https   disable	https-Enable the access to https service.
		disable – Disable web service
httpport	<http port=""></http>	The TCP/IP port of the Hypertext Transfer Protocol
		(HTTP) (80 by default)
	letters a set	The TCP/IP port of the Hypertext Transfer Protocol
httpsport	<https port=""></https>	Secure (HTTPS) (443 by default)
index	1   2     13	Select Cipher Suites list index
status	enable   disable	Enable or disable Cipher Suite

Example 1:

To change the HTTP server port to 5000

CyberPower > web httpport 5000

## console

Description: Show and configure console network access type, telnet port and SSH port.

Option	Argument	Description		
show		Show all console information.		
		disable – Disable console service.		
		telnet – Enable the access to Telnet.		
access	disable   telnet   ssh	<b>ssh</b> – Enable the access to SSH.		
talaat		enable – Enable Telnet.		
telnet	enable   disable	disable-Disable Telnet.		
		enable-Enable SSH.		
aah	enable   disable   reset_hostkey	disable – Disable SSH.		
ssh		reset_hostkey-Reset SSH Hostkey to		
		default.		
talpatrart	to be the orth	The TCP/IP port (23 by default) that		
telnetport	<telnet port=""></telnet>	Telnet uses to communicate.		
achaart	coch port	The TCP/IP port (22 by default) that SSH		
sshport	<ssh port=""></ssh>	uses to communicate.		

Example 1:

To enable Telnet as console type

CyberPower > console telnet enable

Example 2:

To disable SSH as console type CyberPower > console ssh disable

Note: The telnet and the ssh modes are options for switching between each other. For example, the telnet will be automatically disabled once ssh is enabled as console type and vice versa.

Example 3:

To reset SSH Hostkey to default CyberPower > console ssh reset\_hostkey

Note: The system will reboot after the SSH Hostkey is reset to default.

#### ftp

Description: Show and configure FTP access type and TCP/IP port of FTP.

Option	Argument	Description
show		Show all FTP information
access	enable   disable	Enable or disable FTP server
port	<ftp port=""></ftp>	The TCP/IP port of the FTP server (21 by default).

Example 1:

To enable FTP service CyberPower > ftp access enable

# eventlog

Description: View and clear the eventlog of the device.

Option	Argument	Description		
show		Show the list of events and a brief description of each		
show		event along with the date and time stamp.		
clear		Clear the existing event logs.		

Example 1:

CyberPower > eventlog show

12/11/2015 03:32:08 Admin login from 192.168.26.33.

.....

Then use the following keys to navigate the event log.

Кеу	Description
SPACE	View the next page of event log.
Q	Close the event log and return to command line interface.

## Example 2:

To clear all event logs.

CyberPower > eventlog clear

Do you want to clear all eventlog [yes / no]: yes

# syslog

Description: Show and configure information of SYSLOG server.

Option	Argument	Description
show		Show all syslog information.
s1 s2 s3 s4	show	Show syslog server information for 1 to 4 servers.
add		Add syslog server then input syslog server IP /Port appear later on.
add	<server ip=""> <server port=""></server></server>	Add syslog server information including server IP/Port at one time.
access	enable   disable	Enable or disable syslog.
facility	kernel   user   mail   system   auth1   syslog   link   news   uucp   clock1   auth2   ftp   ntp   logaudit   logalert   clock2   local0   local1   local2   local3   local4   local5   local6   local7	Set Syslog facility.
s1test s2test s3test s4test		Send test message to Syslog server for 1 to 4 servers.
lp1 lp2 lp3 lp4	<syslog ip="" server=""></syslog>	Set the IP address of Syslog server for 1 to 4 servers.
port1 port2 port3 port4	<syslog port="" server=""></syslog>	Set the UDP port which is used by the Syslog server 1 to 4 servers.
s1del s2del s3del s4del		Delete Syslog server for 1 to 4 servers.

Example 1:

To view syslog information of server 1

Intelligent PDU/ATS User Guide

```
CyberPower > syslog s1 show
        IP: 192.168.26.33
        Port: 514
Example 2:
    To view syslog information of server 2
    CyberPower > syslog s2 show
        IP: 192.168.203.89
        Port: 268
Example 3:
    To view syslog information of server 3
    CyberPower > syslog s3 show
        IP: 192.168.30.15
        Port: 101
Example 4:
    To view syslog information of server 4
    CyberPower > syslog s4 show
        IP: 192.168.26.93
        Port: 358
```

Enter the following command to perform all parameters configuration with a single command:

```
syslog add <Server IP address> <Server Port>
```

For example:

CyberPower > syslog add 192.168.203.65 180

Note: This single command could not be executed successfully if there are four Syslog servers to be set already.

#### menumode

Description: Switch mode as Menu Mode.

# ассу

Description: Show accessory information.

Option	Argument	Description
show		Show information of accessory.

Example 1:

To display general information of accessory

CyberPower > accy show

,	Model	Serial number	HW version	FW version
1	SENV001	TBLMV2000001	1.0	1.0.4
2	SENV001	TBLMV2000002	1.0	1.0.4

## envsta

Description: Show environment sensor status.

Option	Argument	Description
show		Show status of environment sensor.
index	1   2   3   8	Select environment sensor index.

Example 1:

To display general status of environment sensor

CyberPower > envsta show

	Name	Location	Temp	Humid
1	Name1	Location1	77.21 F	54.00 %RH
2	Name2	Location2	76.33 F	53.00 %RH

# envcfg

Description: Show and set environment sensor configuration.

Option	Argument	Description	
show		Show configuration of environment sensor.	
index	1   2   3   8	Select environment sensor index.	
name	< environment sensor name>	Set environment sensor name.	
location	< environment sensor location>	Set environment sensor location.	
temphthres	<high threshold="" value=""></high>	Set high temperature threshold.	
templthres	<low threshold="" value=""></low>	Set low temperature threshold.	
temphyster	<hysteresis value=""></hysteresis>	Set temperature hysteresis.	
tempchange	<rate change="" of="" value=""></rate>	Set temperature rate of change.	
humhthres	<high threshold="" value=""></high>	Set high humidity threshold.	
humlthres	<low threshold="" value=""></low>	Set low humidity threshold.	
humhyster	<hysteresis value=""></hysteresis>	Set humidity hysteresis.	
humchange	<rate change="" of="" value=""></rate>	Set humidity rate of change.	
movminrooot		Reset maximum and minimum record of	
maxminreset	<temp humid=""  =""></temp>	temperature or humidity.	
unit	<celcius fahrenheit=""  =""></celcius>	Set temperature unit	

Example 1:

To display general configuration of environment sensor

CyberPower > envcfg show

 Name	Location	Temperature [HTH LTH HYS	• •	Humidity(%R [HTH LTH HY9	•
Name1 Name2	Location1 Location2	[158 33  3 [158 33  3	• •		• •

\*HTH = High Threshold \*LTH = Low Threshold
\*HYS = Hysteresis \*CAG = Change Rate(per 5min)

Example 2:

To set accessory#1's name as envirname1

CyberPower > envcfg index 1 name envirname1

Example 3:

To set high temperature threshold of the accessory#1 at 70 CyberPower > envcfg index 1 temphthres 70 Example 4:

To reset maximum and minimum record of accessory#1 temperature

CyberPower > envcfg index 1 maxminreset temp

Example 5

To set temperature unit as celcius CyberPower > envcfg unit celcius

#### contactsta

Description: Show contact status.

Option	Argument	Description		
show		Show status of contact.		
index	1   2   3   8	Select contact index.		

Example 1:

To display general status of contact

CyberPower > contactsta show

-	name	name	name	name	status
	contact1	contact2	contact3	contact4	[#1 #2 #3 #4]
			.		-
1	contact1-1	contact1-2	contact1-3	contact1-4	[ x  x  x  x]
2	contact2-1	contact2-2	contact2-3	contact2-4	[ X  X  X  X]

\*O = Normal \*X = Abnormal

# contactcfg

Description: Show and set contact configuration.

Option	Argument	Description
show		Show configuration of contact.
index	1   2   3   8	Select contact index.
contact1name	<contact name=""></contact>	Set contact 1 name.
contact1state	<open closed=""  =""></open>	Set contact 1 state
contact2name	<contact name=""></contact>	Set contact 2 name.
contact2 state	<open closed=""  =""></open>	Set contact 2 state
contact3name	<contact name=""></contact>	Set contact 3 name.
contact3 state	<open closed=""  =""></open>	Set contact 3 state
contact4name	<contact name=""></contact>	Set contact 4 name.
contact4 state	<open closed=""  =""></open>	Set contact 4 state

Example 1:

To display general configuration of contact

CyberPower > contactcfg show

Example 2:

To set envirsensor#1's contact 2 name as contact1-2

CyberPower > contactcfg index 1 contact2name contact1-2

## clear

Description: Clear the console screen

## exit

Description: Close the connection to the command line interface.

# Save and Restore Configuration Settings

#### **Option 1: via Web interface**

You can easily save and restore the device configuration to your local PC on System > About.

PDU Remote Managemer	It	Administrator login from 192.168.25.28 <u>&amp;</u> [Logout] Summary   PDU   Envir   Log   <mark>System</mark>   Help	
<b>6</b> 1	About		
General	Information		
Security Network Service	Model	PDU81001	
Notification	Serial Number	123456789011	
Reset/Reboot	Hardware Version	1.1	
About	Firmware Version	1.3.2	
About	Firmware Update Date	2023-11-16	
	MAC Address	00-0C-15-40-50-72	
	Save/Restore Configuration	on	
	Save Configuration	Save	
	Restore Configuration	Select File	
		Submit	
	Diagnostic Informatio	on	
	Save Information	Save	

To save the configuration file, click "Save" to save the configuration to your local PC. The text file will have a default format of YYYY\_MM\_DD\_HHMM.txt. To restore configuration, click "Browse" to the location of the saved configuration file and click "Submit" to restore a configuration that has been saved earlier.

**Option 2: via File Transfer Protocol (FTP)** 

Note: Only firmware version 1.2.6 and above supports the functionality to download configuration file via FTP.

Use the following steps to save configuration via FTP.

1. Open a command prompt window and navigate to "C:\".

- 2. Login to the PDU/ATS with FTP command, type
  - C:\>ftp

- ftp> open 192.168.22.126 21 (for example: 192.168.22.126 is the current IP

of the PDU/ATS and 21 is the default ftp port for the PDU/ATS)

- Connected to 192.168.22.126.
- 220 CyberPower FTP Server Ready.
- User (192.168.22.126:(none)):cyber
- 331 User name okay, need password.
- Password:
- 230 User logged in, proceed.
- ftp>
- 3. Download the configuration file, type
  - ftp> get <filename>
- 4. Download is complete, type
  - ftp> quit
- **Note:** <filename> is the configuration file with format of .TXT. Maximum length of filename is 32 characters, excluding the file extension(.TXT).

For example: -ftp> get YYYY\_MM\_DD\_HHMM.txt YYYY\_MM\_DD\_HHMM.txt is the configuration file to be saved.

Use the following steps to restore configuration via FTP.

- 1. Open a command prompt window and navigate to "C:\".
- 2. Login to the PDU/ATS with FTP command, type
  - C:\>ftp
  - ftp> open 192.168.22.126 21 (for example: 192.168.22.126 is the current IP
  - of the PDU/ATS and 21 is the default ftp port for the PDU/ATS)
  - Connected to 192.168.22.126.
  - 220 CyberPower FTP Server Ready.
  - User (192.168.22.126:(none)):cyber
  - 331 User name okay, need password.
  - Password:
  - 230 User logged in, proceed.
  - ftp>
- 3. Upload the configuration file, type

- ftp> put <filename>
- 4. Upload is complete, type
- ftp> quit
- 5. The system will reboot after you type "quit".

#### Option 3: Use Secure Copy (SCP) command

Use the following steps to restore configuration via SCP.

Note: Only firmware version 1.1.2 and above supports the functionality to restore configuration via SCP.

#### For Windows Users:

- 1. Download any PuTTY Secure Copy client (PSCP) utility.
- 2. Save the configuration file and the PSCP Utility in the same folder.
- 3. Open the Command Line Interface and change the path to where the configuration file and the PSCP Utility are saved.
- 4. Enter the following command to restore configuration:

```
pscp -scp <filename> <user>@<IP address of PDU/ATS>:
```

#### Note:

- (1) The SSH setting on the PDU/ATS must be Enabled.
- (2) <filename> is the filename of the configuration file with a default format of YYYY\_MM\_DD\_HHMM.txt.
- (3) <user> is the username of the SSH account on the PDU/ATS.
- (4) Ensure to add ":" after the IP address.

For example:

pscp -scp YYYY\_MM\_DD\_HHMM.txt cyber@192.168.1.100:

**Note:** YYYY\_MM\_DD\_HHMM.txt is the configuration file to be restored.

- After executing the command, a message may appear asking if you trust the host. To continue type
  "y" for yes within 10 seconds.
- 6. On the next screen enter the PDU/ATS password. Please wait until the progress indicator displays 100%. The system will automatically log out and reboot after the transfer is complete.

#### For Linux, MacOS and Unix Users:

- 1. Install the related distribution of an SSH or SCP client, for example OpenSSH client.
- 2. Open the Terminal and change the path to where the configuration files are saved.

3. Enter the following Command to restore configuration:

scp <filename> <user>@< IP address of PDU/ATS>:

#### Note:

- (1) The SSH setting on the PDU/ATS must be Enabled.
- (2) <filename> is the filename of the configuration file with a default format of YYYY\_MM\_DD\_HHMM.txt.
- (3) <user> is the username of the SSH account on the PDU/ATS.
- (4) Ensure to add ":" after the IP address.

For example:

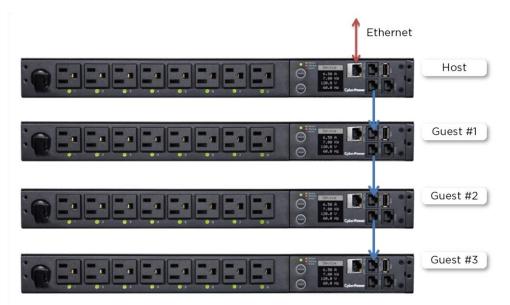

scp YYYY\_MM\_DD\_HHMM.txt cyber@192.168.1.100:

Note: YYYY\_MM\_DD\_HHMM.txt is the configuration file to be restored.

- 4. After executing the command, a message may appear asking if you trust the host. To continue type "y" for yes within 10 seconds.
- 5. On the next screen enter the PDU/ATS password. Please wait until the progress indicator displays 100%. The system will automatically log out and reboot after the transfer is complete.

# **PDU/ATS Network Daisy Chain**

The daisy-chain function allows up to four PDU/ATSs to be connected together to be monitored and controlled from one IP address.

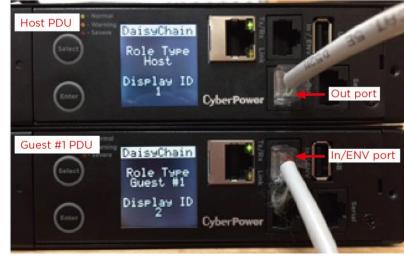

When PDU/ATSs are connected, two roles are defined: Host and Guest. Up to three Guest PDU/ATSs can be connected to one Host PDU/ATS. The Guest PDU/ATSs will be recognized by serial number and their order within the daisy-chain.

**Note**: To perform the daisy-chain function, the firmware version of the connected PDU/ATSUs needs to be the same (v1.08 or above).

## How to connect the PDU/ATSs together?

Use one Ethernet cable and connect one end of it to the daisy-chain (Out) port on the Host PDU and the other end to the daisy-chain (In/ENV) port on the Guest 1 PDU/ATS to connect the PDU/ATSs (as

# shown below).

## What remote management protocols are supported in PDU/ATSU daisy-chains?

Currently users can monitor and control daisy-chained PDU/ATSs through Web interface (HTTP/HTTPS) or SNMP protocols.

# What functions on the Web pages does daisy-chain support?

Please find in below table:

Summary			
	Device Status		
	Outlet Status		
	Source Manager*		
PDU/ATS	Device Manager		
FDU/AIS	Bank Manager		
	Outlet Manager		
	Outlet Control		
	Outlet Schedule		
	Status Records		
Log	Energy Records		
	Graphing		
System	Identification		

\*For ATS Series Only

## How to switch between Host and Guest PDU/ATSs on the Web interface?

Functionality supported by daisy-chained PDU/ATSs will have the Host/ Guest # drop down menu displayed on the Web interface (as shown below).

PDU Remote Ma	anagement	Administrator login from 192.168.26.168 🔏 [Logou Summary   PDU   Envir   Log	t) System   Help	Cyber <b>Power</b>

### Can I upgrade the firmware version of the Guest PDU/ATSs through the Host PDU/ATS?

Yes, you can upgrade the firmware using the Power Device Network Utility 2,

FTP (network connection required), or USB port. Once the Host completes the PDU/ATS firmware upgrade, it will trigger its Guest PDU/ATSs to upgrade the firmware automatically. It takes about 5 minutes for the Guest PDU/ATSs to upgrade, regardless of the number of PDU/ATSs in the series.

## What will happen if an Ethernet cable is disconnected in the PDU/ATS daisy-chain?

For example, if four PDU/ATSs are connected and the cable connecting Guest 1 and 2 is disconnected, then Guest 2 and 3 will no longer be detected by the Host PDU/ATS. An event showing that Guest 2 and 3 are removed will be recorded in the Host PDU/ATS. Meanwhile, Guest 2 and 3 will create a new daisy-chain where Guest 2 becomes a Host and Guest 3 becomes Guest 1 to the new Host.

# In the above example, if the disconnected Ethernet cable is re-connected, will the role of the PDU/ATSs stay the same?

Yes, when the disconnected cable between Guest 1 and 2 is re-connected, Guest 2 and 3 will revert to their previous roles.

## What happens if one PDU/ATS in the daisy-chain is powered off?

For example, if four PDU/ATSs are connected and Guest 1 is powered off, an event showing that Guest 1, 2 and 3 are removed will be recorded in the Host PDU/ATS. Guest 2 and 3 will not create another daisy-chain.

#### Does the Host PDU/ATS record the logs of the Guest PDU/ATSs and itself?

Yes, the Host PDU/ATS records the logs from all Guest PDU/ATSs daisy-chained to it.

# Will the Logs of the Guest PDU/ATSs recorded in the Host PDU/ATS be cleared if the Guest PDU/ATSs are removed from the Host PDU/ATS?

No, the Logs of the Guest PDU/ATSs will remain even after the Guest PDU/ATSs are removed.

Does the Host PDU/ATS record the Status Records of the Guest PDU/ATSs and itself? Yes, the Host PDU/ATS records the Status Records for all the PDU/ATSs in the daisy-chain. Will the Status Records of the Guest PDU/ATSs logged in the Host PDU/ATS be cleared if the Guest PDU/ATSs are disconnected from the Host PDU/ATS?

Yes, once the Guest PDU/ATSs are removed, the Status Records logged in the Host PDU/ATS will be cleared. As long as the Host PDU/ATS does not connect to other PDU/ATS s, the Status Records of the disconnected PDU/ATS can be displayed when it is re-connected to the Host PDU/ATS. If the Host PDU/ATS connects to different PDU/ATS s, the Status Records of the removed PDU/ATS will be entirely cleared.

#### Are the Guest PDU/ATS s able to connect to the network when they are daisy-chained?

Yes, even when the PDU/ATS s are daisy-chained, the Guest PDU/ATS s are able to connect to the network directly. Note that a Guest PDU/ATS will require having its own Ethernet cable connected to the network.

#### What will happen if a 5th PDU/ATS is added to a daisy-chain?

The maximum number of PDU/ATS s that can be connected in one daisy-chain is 4. The daisy-chain functionality will not work until the fifth PDU/ATS is removed.

What is the maximum recommended length of the Ethernet cable to daisy-chain the PDU/ATS s? 50 ft (15 m)

# Firmware Upgrade

By upgrading the Firmware, you can obtain new features and updates/improvements to existing functionality. To ensure the firmware is kept up to date, please regularly visit our website to see if there is any updated firmware version available. There are three methods for upgrading the PDU/ATS firmware. Please follow the instructions below for the method that is appropriate for your application. There are two files to update in order to upgrade the firmware version:

- \* cpsmpdumadata\_XXX.bin
- \* cpsmpdumafw\_XXX.bin

Note that the XXX is not part of the file name but is where the version number in the filename is given.

Prior to performing a firmware update, please:

- Download the latest firmware from <u>www.cyberpower.com</u>
- Extract the downloaded firmware file to your local "C:\" drive

## Note:

- 1. The FTP service needs to be enabled before attempting to execute a firmware upgrade. Please refer to 5.7 FTP Service to make sure that FTP is enabled.
- Please do not turn the PDU/ATS off when processing the Firmware upgrade. PDU/ATS outlets will remain powered on while the firmware update takes place. Only the PDU/ATS LCD screen will reboot.
- The PDU/ATS LCD screen will reboot during the firmware update process. This DOES NOT cause the PDU/ATS outlets to reboot.

## **Option 1: Single Device Upgrade via FTP**

Use the following steps to upgrade the firmware.

- 1. Open a command prompt window and navigate to "C:\".
- 2. Login to the PDU/ATS with FTP command, type
  - C:\>ftp

- ftp> open 192.168.22.126 21 (for example: 192.168.22.126 is the current IP of

the PDU/ATS and 21 is the default ftp port for the PDU/ATS)

- Connected to 192.168.22.126.
- 220 CyberPower FTP Server Ready.
- User (192.168.22.126:(none)):cyber
- 331 User name okay, need password.
- Password:
- 230 User logged in, proceed.
- ftp>

- 3. Upload the cpsmpdumadata\_XXX.bin, type
  - ftp > bin
  - ftp > put cpsmpdumadata\_XXX.bin
- 4. Upgrade complete, type
  - ftp > quit
- 5. The system will reboot after you type "quit". This reboot will take approx. 30 seconds.
- 6. Login to the PDU/ATS via FTP again, type
  - C:\>ftp

- ftp> open 192.168.22.126 21 (for example: 192.168.22.126 is the current IP of

the PDU/ATS and 21 is the default ftp port for the PDU/ATS)

- Connected to 192.168.22.126.
- 220 CyberPower FTP Server Ready.
- User (192.168.22.126:(none)):cyber
- 331 User name okay, need password.
- Password:
- 230 User logged in, proceed.
- ftp>
- 7. Upload cpsmpdumafw\_XXX.bin, type
  - ftp > bin
  - ftp > put cpsmpdumafw\_XXX.bin
- 8. Upgrade complete, type
  - ftp > quit
- 9. The system will reboot after you type "quit".

**Option 2: Single or Multiple Device Upgrade (recommended)** 

Use the following steps to upgrade the firmware.

- 1. Install the Power Device Network Utility 2 available for download at www.cyberpower.com
- 2. After installation completes, run the Power Device Network Utility 2.
- 3. Wait for scanning to finish (shown in Figure 1).

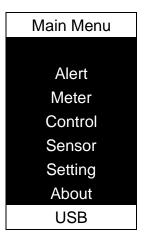

Figure 6.

Note: If you don't want to wait for the firmware upgrade, you can stop the process by clicking Cancel in the lower right Upload Firmware window. However, this is not recommended because the Cancel action may cause the device to malfunction.

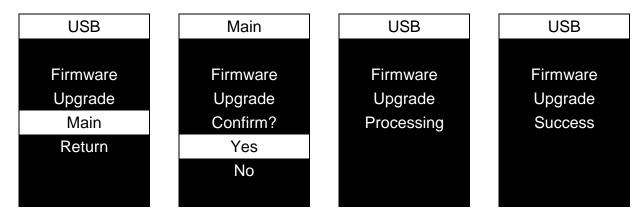

## **Option 3: Use a USB Flash Drive**

Use the following steps to upgrade the firmware.

- 1. Download the latest firmware from www.cyberpower.com
- Extract the file to the root directory of a USB flash drive with FAT32 formatting. Please note that the two files below should be available in order to complete the firmware upgrade process: \*cpsmpdumadata\_xxx.bin
  - \*cpsmpdumafw\_xxx.bin
- 3. Plug the USB drive into the PDU/ATS USB port and press Enter on the PDU/ATS LCD screen to enter Main Menu. The USB option will be displayed.

- 4. Select USB and press Enter button to enter Firmware Upgrade menu.
- 5. Select Main and Yes to start the upgrade process.

6. The PDU/ATS will reboot after the process is completed.

Note: You can check to see if the firmware upgrade is successful by checking the "Firmware version" on the [System->About] webpage. You can also check Firmware Version on LCD screen. Press Enter on the LCD screen to enter Main Menu. Select About and press Enter to see the PDU/ATS information. Select Firmware Version to check the PDU/ATS Firmware Version. Option 4: Use Secure Copy (SCP) command Use the following steps to update the firmware via SCP. Note: Only firmware version 1.10 and above supports the functionality to update firmware via SCP.

#### For Windows Users:

- 1. Download any PuTTY Secure Copy client (PSCP) utility.
- 2. Save the firmware files and the PSCP Utility in the same folder.
- Open the Command Line Interface and change the path to where the firmware files and the PSCP Utility are saved.
- 4. Enter the following command to perform the firmware update:

```
pscp -scp <filename> <user>@<IP address of PDU/ATS>:
```

#### Note:

- (5) The SSH setting on the PDU/ATS must be Enabled.
- (6) <filename> is the filename of the firmware file. There are two firmware files to upload: cpsmpdumadata\_XXX.bin and cpsmpdumafw\_XXX.bin. In order to upgrade the firmware version both files need to be uploaded. Only one firmware file can be uploaded at a time, it is recommended to upload the data file cpsmpdumadata\_XXX.bin first followed by the firmware file cpsmpdumafw\_XXX.bin.
- (7) <user> is the username of the SSH account on the PDU/ATS.
- (8) Ensure to add ":" after the IP address.

For example:

pscp -scp cpsmpdumafw\_XXX.bin cyber@192.168.1.100:

**Note:** cpsmpdumafw\_XXX.bin is the firmware file of the version being updated.

- 5. After executing the command, a message may appear asking if you trust the host. To continue type "y" for yes within 10 seconds.
- On the next screen enter the PDU/ATS password. Please wait until the progress indicator displays 100%. The system will automatically log out and reboot after the transfer is complete.
- 7. Repeat steps 4 through step 6 to upload the firmware file cpsmpdumafw\_XXX.bin to complete the firmware update process.
- 8. If the firmware file transfer is unsuccessful you will see an error message. Attempt to retype the command and execute it again.

#### For Linux, MacOS and Unix Users:

- 1. Install the related distribution of an SSH or SCP client, for example Openssh client.
- 2. Open the Terminal and change the path to where the firmware files are saved.
- 3. Enter the following Command to perform firmware update:
  - scp <filename> <user>@< IP address of PDU/ATS>:

#### Note:

- (1) The SSH setting on the PDU/ATS must be Enabled.
- (2) <filename> is the filename of the firmware file. There are two firmware files to upload: cpsmpdumadata\_XXX.bin and cpsmpdumafw\_XXX.bin. In order to upgrade the firmware version both files need to be uploaded. Only one firmware file can be uploaded at a time, it is recommended to upload the data file cpsmpdumadata\_XXX.bin first followed by the firmware file cpsmpdumafw\_XXX.bin.
- (3) <user> is the username of the SSH account on the PDU/ATS.
- (4) Ensure to add ":" after the IP address.

For example:

scp cpsmpdumafw\_XXX.bin cyber@192.168.1.100:

Note: cpsmpdumafw\_XXX.bin is the firmware file of the version being updated.

- After executing the command, a message may appear asking if you trust the host. To continue type
  "y" for yes within 10 seconds.
- 5. On the next screen enter the PDU/ATS password. Please wait until the progress indicator displays 100%. The system will automatically log out and reboot after the transfer is complete.
- 6. Repeat steps 3 through step 5 to upload the firmware file cpsmpdumafw\_XXX.bin to complete the firmware update process.
- 7. If the firmware file transfer is unsuccessful you will see an error message. Attempt to retype the command and execute it again.
